Comfort in Echo for AutoSense OS

What is it?

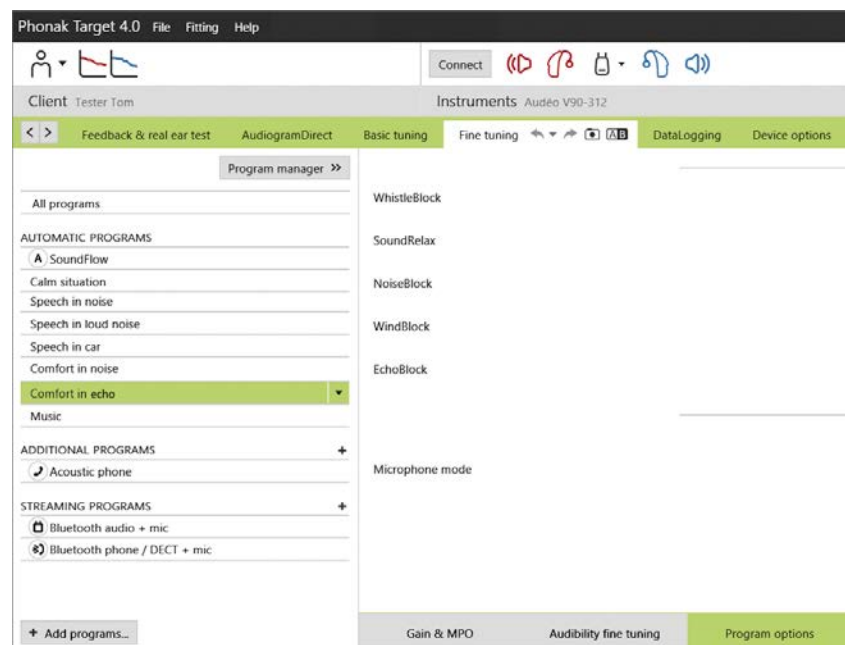

Comfort in Echo is a program within the Phonak automatic operating system, AutoSense OS. In a reverberant echo situation, AutoSense OS will activate the Comfort in Echo program, reduces the disturbing effects of reverberation and making listening easier.

Why use it?

The benefit for your client is that their hearing aids will automatically recognize disturbing echo in different situations and will reduce this uncomfortable sensation. This results in less distortion, making speech more comfortable.

How do I use it?

In the Phonak Target 4.0 fitting software the Comfort in Echo program settings can be easily managed in the automatic programs options screen, allowing for program specific fine tuning adjustments that will not impact any other of the other programs within AutoSense OS.
