Did you know hearing better can help you think better?

The brain and the ears are equal partners. Hearing well supports your brain health and is a key factor in healthy aging.

So, if busy places feel like more of a strain on your brain lately, it could be your hearing. When you improve the quality of the sound you increase your chance of understanding.

A recent study found that in older adults with more risk factors for cognitive changes, treating hearing loss with hearing aids slowed down loss of thinking and memory by 48%.[1]

This finding highlights the link between cognition and hearing loss and why taking action is so important for healthy aging and nurturing your brain.
